

## **ALQUERFLAV RUMIANTES VO**

### **DESCRIPTION**

Powder premix that contains natural and synthetic flavours intended for adult cattle and ovine in rumia phase.

### **TECHNICAL PROPERTIES**

Flavours are used in animal nutrition to improve the acceptance of low palatability diets, increase feed intake in high palatability diets or increase intake in high stress periods like weaning.

Many field studies support that adding flavours to feedstuff has some advantages:

- Regulate feed intake, covering taste and smell variations.
- Increase feedstuff intake, improving performance.
- Ensure intake continuity, even in front of changes in formulation.
- Allow higher formulation flexibility.
- Cover unpleasant tastes, like bitter, acid and astringent ones.
- Facilitate change from liquid to solid nutrition in young animals.
- In weaning animals, flavours stimulate salivation and enzyme secretion, create taste preferences, act as antistress agents that reduce nutritional disorders and promote the formation of lean meat because of early-improved intake.
- Preference index in flavoured feedstuffs is higher than in not flavoured feedstuffs, especially in those intended for young animals.
- Flavours persist after granulation processes: aromatic intensity of feed is 70% of original 70 days after granulation.

As a general rule, adult ruminants like herbal flavours (thymus, fenugreek and hay).

**ALQUERFLAV RUMIANTES VO** is composed by natural flavours and their synthetic analogues, giving a herbal and spicy aroma with citric tones.

### **INDICATIONS AND SPECIES**

It is indicated to adult cattle and ovine in rumia phase.

### **DOSAGE**

Mix with feed at doses of 0.5-1 kg/ton.

### **PACKAGING**

Bags of 25 kg.
